Highly accurate OSAs for current and next-generation networks

- Best-in-class resolution bandwidth
- Truly portable spectral characterization for DWDM network commissioning
- In-band OSNR measurement for 40 Gbit/s and ROADM deployments
- Automated channel discovery feature for easy setup and measurement
- Over 90 dB dynamic range per scan
- High-power option, ideal for multiservice operators and CATV operators

Platform compatibility

- FTB-200 Compact Platform
- FTB-500 Platform
Choice without Compromise

The all-new FTB-5240S and FTB-5240BP Optical Spectrum Analyzer (OSA) series covers your DWDM applications and all channel spacings, from 50 GHz DWDM to CWDM. This is what we call “no-compromise performance”, whatever your network specificities and testing requirements.

Nimble OSA Meets Supertech Platforms

The FTB-5240S OSA test module, housed in either the FTB-200 Compact Platform or the FTB-500 Platform, is purpose-built for fast and accurate dense wavelength-division multiplexing (DWDM) network commissioning and high-speed networking—up to 40 Gbit/s.

Housing the FTB-5240S in the FTB-200 platform makes it the smallest, high-performance, portable solution for spectral characterization of next-generation networks on the market. When equipped with in-band optical-signal-to-noise-ratio (OSNR) measurement capabilities in the FTB-500 platform, this versatile OSA can also be combined with the FTB-8140 Transport Blazer 40/43 Gigabit SONET/SDH/OTN Test Module to create a unique test solution for commissioning reconfigurable optical add/drop multiplexers (ROADMs), packet optical transport platforms (POT-Ps) and 40 Gbit/s systems.

Quicker Setups—Easier Testing

The application software has been designed to optimize all testing operations—boosting productivity.

Optical Spectrum Analyzers

Ready for Next-Generation Network Challenges

Faster Is Always Better
Testing speed is critical, which is why EXFO’s FTB-5240S and FTB-5240BP OSAs housed in the FTB-500 Platform, will achieve a scan and display the results in less than one second—that’s fast enough for highly efficient network element adjustments on the go.

Get the Clear Picture
The FTB-5240BP high-resolution OSA has the best optical resolution in the industry (33 pm typical)—such a resolution enables to see events in your network that are not usually visible, i.e., integrity of filters, flatness of interleavers, spectral content of advanced modulation formats, and more.

Sharp In-Band OSNR Measurement—No Extra Hardware Needed
Thanks to its flexible and innovative patent-pending analysis method, EXFO’s FTB-5240S-P-InB and FTB-5240BP delivers highly accurate OSNR measurements for systems where noise fluctuates from channel to channel. The IEC subsystem test procedure 61280-2-9 recommendation defines OSNR measurement as “the difference in power between the peak power and the noise at half the distance between the peaks”. However, in ROADM or 40 Gbit/s systems, this method may lead to incorrect results.

The built-in polarization diversity detection of EXFO’s OSAs, combined with an internal polarization controller, enables you to achieve accurate OSNR measurements of a ROADM system, without having to add external hardware.

Measurement Characteristics
- Multiple scans, changing the polarization state between them and using the data to determine the OSNR in-band for each channel
- For new modulation schemes, such as non-return-to-zero (NRZ), duo binary, differential phase-shift keying (DPSK), quadrature phase shift keying (QPSK), which present large line widths and often display multiple peaks, in-depth analysis ensures the correct identification and signal measurement of each carrier
- Simultaneous testing of the physical and transport or datacom layers when combined with other EXFO modules in the FTB-500 Platform

High-Power Option
With today’s high-power signals making their way into the DWDM space, it is critical to have an OSA that can measure them accurately without risking damaging your test equipment. The FTB-5240S matches this need, offering a high-power option (FTB-5240S-HPW) allowing up to +23 dBm input power per channel. The option is available with or without the in-band capability.

Protecting Your Investment
If you already own an FTB-400 platform and are looking for an OSA to use with your current applications, consider the FTB-5240S and FTB-5240BP as fully compatible with the FTB-400-based OSA application.

The higher resolution of the FTB-5240BP (lower trace) enables to see event not seen by standard-resolution OSAs (higher trace), such as the ripple on this interleaver.

### In-Band OSNR Measurements d,k FTB-5240S-P only FTB-5240BP

| **OSNR dynamic range (dB)** | >95 | >95 |
| **OSNR measurement uncertainty (dB)** | ±0.5 | ±0.5 |
| **Repeatability (dB)** | ±0.2 | ±0.2 |
| **Data signals** | Up to 100 Gbit/s | Up to 100 Gbit/s |
| **Measurement time** | <8 (eight scans with the FTB-500 platform) | <8 (eight scans with the FTB-500 platform) |

### Notes a

- All specifications are for a temperature of 23 °C ± 2 °C with an FC/UPC connector unless otherwise specified, after warm-up.
- From 1520 to 1610 nm.
- After user calibration in the same test session within 10 nm from each calibration point.
- Typical.
- Integrated and wavelength-independent self-adjustment.
- Full width at half maximum.
- Over one minute in continuous acquisition mode.
- With averaging.
- At 1550 nm, –10 dBm input.
- 45 nm span, full resolution, 20 peak analysis.
- In-band OSNR measurement performed with 64 scans.
- For an optical noise level of > –60 dBm.
- With PMD ≤ 15 ps and no crosstalk, uncertainty specification is valid for OSNR ≤ 25 dB. With PMD ≤ 15 ps and crosstalk, uncertainty specification is valid for OSNR ≤ 20 dB.
- Repeatability specification is valid for OSNR ≤ 25 dB.
- Except for pol-mux and fast polarization scrambled signals.
